Session 4 — Add and Display Modules

Objective

Implement the first two operations of CRUD: Create (add a new module) and Read (display all modules for the logged-in user).

1. CRUD Reminder — Create and Read

CRUD is the foundation of any data-driven web application. This week you implement the first two operations:

Technology	What It Does
C — Create	The user fills in a form and saves a new module to the database
R — Read	The application fetches all modules from the database and displays them

2. Module Fields

Each module has 7 data fields. These fields will later be sent to the AI to generate a revision plan:

Technology	What It Does
module_name	Name of the subject (e.g. Mathematics, Web Techniques)
teacher	Name of the teacher for this module
difficulty	How hard the module is: Easy, Medium, or Hard
career_importance	How important it is for the future: Low, Medium, or High
progress	How much work has been done so far (0 to 100 %)
understanding_level	Current understanding: Low, Medium, or High
exam_date	The date of the upcoming exam

3. Practical Tasks This Week

1	Create add_module.php with a form for all 7 module fields
2	Use <select> for difficulty, career_importance, and understanding_level
3	Process the form in PHP and INSERT the data into the modules table
4	Link the module to the logged-in user using \$_SESSION['user_id']
5	Create modules.php that SELECTs and displays all modules of the current user

- 6 Display modules in an HTML table or as cards
- 7 Add links: Edit and Delete on each module row

Expected Result by End of Week

- ✓ The user can add a module using the form
- ✓ The module appears in the modules list after submission
- ✓ Each module shows its name, difficulty, exam date, and progress
- ✓ Only the logged-in user's modules are shown

Advice & Common Mistakes to Avoid

- ! Always validate that numeric fields like progress are between 0 and 100
- ! Use WHERE user_id = ? in your SQL query — never show modules of other users
- ! Escape user input to avoid SQL injection — use prepared statements with PDO
- ! Keep the interface simple: a table with columns is perfectly fine for now

Prepare for Next Week

- Be ready to add Edit and Delete functionality
- Review UPDATE and DELETE SQL statements
- Think about how to pre-fill the edit form with existing module data
