Session 5 — Edit and Delete Modules

Objective

Complete the CRUD system by implementing Update (edit a module) and Delete (remove a module). Test the full CRUD cycle end-to-end.

1. Completing CRUD

A complete CRUD system allows the user to manage all their data. This week you add the last two operations:

Technology	What It Does
U — Update	The user opens an edit form pre-filled with the module's current data and saves changes
D — Delete	The user removes a module from the database after a confirmation step

2. Key Concepts

- **Pre-filling the edit form:** use **SELECT** to fetch the current module data, then put it in form field values
- **The UPDATE SQL statement:** modifies existing rows in the database
- **Delete confirmation:** ask the user before deleting to avoid accidents

```
-- Update a module:
UPDATE modules SET module_name=?, difficulty=?, exam_date=?
WHERE id=? AND user_id=?;

-- Delete a module:
DELETE FROM modules WHERE id=? AND user_id=?;
```

3. Practical Tasks This Week

- 1 Create edit_module.php — fetch the module by id using SELECT
- 2 Display an HTML form pre-filled with the module's current values
- 3 Process the edit form and run an UPDATE SQL statement
- 4 Create delete_module.php — confirm with the user before deleting
- 5 Run a DELETE SQL statement and redirect back to the modules list
- 6 Test the complete CRUD cycle: Add → Display → Edit → Delete

7 Verify that a user can only edit or delete their own modules

Expected Result by End of Week

- ✓ The user can edit any module and see the updated values immediately
- ✓ The user can delete a module with a confirmation step
- ✓ The full CRUD cycle works correctly from start to finish
- ✓ All data operations are restricted to the logged-in user

Advice & Common Mistakes to Avoid

- ! Always include `AND user_id = ?` in your UPDATE and DELETE queries — never trust the id alone
- ! Test deletion with real data to make sure it works and redirects correctly
- ! Reuse your `add_module` form for editing — just pre-fill the values
- ! Always test with multiple modules and different users if possible

Prepare for Next Week

- Think about how the dashboard can show useful summary information
- Prepare to style the application more carefully with CSS3
- Review how to display conditional content in PHP
